

OFFICIAL / MINISTERIAL BRIEFING

Fertilizer Management

The Path to Bloom

A ministerial blueprint for completing Bangladesh's fertilizer journey — from abundant national supply to every farmer's hands — built on the Krishak Card digital rail, the 2026 Dealer Policy, and the proven experience of India, China, Vietnam and the Philippines.

1. Executive Summary

Bangladesh's agricultural sector stands at a defining opportunity. More than 1.365 million tonnes of fertilizer are ready in government warehouses, endorsed imports of 365,000 tonnes worth Tk 2,562 crore are moving smoothly through the pipeline, and national stocks comfortably exceed projected requirements for the coming months. Farmers in Rajshahi, Jashore, Kurigram and Lalmonirhat are eager to convert this abundance into record harvests, and their eagerness for fair, fast access, unmistakable in Bhurungamari, shows just how much a trusted delivery system is already valued. The opportunity, this briefing concludes, is not one of supply, which is already a national strength. It lies in distribution excellence, institutional integrity and precise subsidy targeting.

The fiscal commitment is equally historic. Fertilizer subsidies represent roughly 80 percent of public agricultural spending — a landmark investment of Tk 17,001 crore, supplemented by an additional allocation of Tk 1,350 crore in the 2025-26 fiscal year. World Bank assessments confirm a golden opportunity to sharpen targeting: guiding a greater share of this investment toward the bottom 40 percent of farmers, the families who will turn every taka into food security, will multiply national returns beyond the current 15 percent share. At the same time, more than 70 percent of national fertilizer demand is met through imports, presenting a clear pathway to strengthen domestic production, build resilience against global price movements and deepen food sovereignty.

Tk 17,001 Cr HISTORIC INVESTMENT IN FARMERS	1.365M t READY IN NATIONAL STORES	72 : 1 PROJECTED PILOT ROI	< 5% TARGET EFFICIENCY FLOOR
--	--	--------------------------------------	--

This report maps the greatest opportunities for value creation, inventories the digital assets already at the Ministry's disposal, distils proven lessons from four Asian comparators, and presents a phased, technically feasible and politically championed reform roadmap. The framework aligns with the Sustainable Development Goals, with FAO's Four Betters agenda, and with the farmer-first ethos of Bir Uttam President Ziaur Rahman. The analysis draws on the February 2026 comparative study Learning from Asia, the KrishiChain BD pilot proposal, and the September 2026 strategic report on fertilizer distribution reform.

Core Recommendation. Transition from a blanket, dealer-centric subsidy model to a biometrically authenticated, land-linked, digitally tracked distribution system that ensures the right farmer receives the right input, at the right price, at the right time. Efficiency recovery alone is projected to return **Tk 2,000 to 3,000 crore to the nation every year**, allowing the reform programme to pay for itself within two to three fiscal cycles and to fund ever-greater farmer prosperity thereafter.

The report is organised in six substantive parts. Part I quantifies the opportunity through district-level evidence. Part II maps the turning point: the digital assets in hand and the lessons Asia has already paid for.

Part III sets out the four-layer digital architecture and the KrishiChain BD proof of concept. Part IV describes the bloom, the measurable end-state for farmers and for the state. Part V presents the 60-month implementation roadmap with a full monitoring, evaluation and learning framework. Part VI closes with seven immediate ministerial recommendations.

2. The Opportunity: Abundance Ready for Perfect Delivery

The scale of the opportunity is best appreciated by holding two pictures side by side: the nation's impressive supply achievements, and the farm-gate prosperity those achievements are ready to deliver. On the national ledger, abundance is the story. At the farm gate, the next chapter is being written. The distance between these two pictures is precisely the value a modernized distribution system will unlock for every farmer in Bangladesh.

2.1 Two Pictures: National Abundance and the Farm-Gate Opportunity

At national level the government holds 1.365 million tonnes of fertilizer in its warehouses, with a further 365,000 tonnes of approved imports worth Tk 2,562 crore in the pipeline. Stocks exceed projected requirements for the coming months, and the Bangladesh Agricultural Development Corporation continues to publish healthy allocation figures for every division. By any supply-side measure the country has enough fertilizer.

The farm-gate picture is where the opportunity shines brightest. In Rajshahi, a 50-kilogram bag of TSP with an official price of Tk 1,350 currently trades at Tk 1,700 to 1,800. In Jashore, TSP trades at around Tk 52 per kilogram against an official price of roughly Tk 26, a full 100 percent premium. In Mymensingh division dealers have lifted 32 percent of their allocated stock, revealing exciting headroom for faster, better-coordinated distribution. In Bhurungamari, Kurigram, farmers' eagerness for reliable, fairly priced supply was unmistakable — a powerful signal of the demand a trusted system will satisfy. These signals pinpoint exactly where digitized distribution will create the greatest immediate value for farmers and the exchequer alike.

District / Division	Official price	Market price	Allocation vs lifted	Status
Rajshahi (TSP)	Tk 1,350 / 50 kg	Tk 1,700 - 1,800	not disclosed	+33% premium
Jashore (TSP)	~Tk 26 / kg	Tk 52 / kg	not disclosed	+100% premium
Gazipur (Urea)	official MRP	above MRP	800 / 1,876 t	43% lifted
Dhaka Division (8 districts)	official MRP	above MRP	8,965 / 19,918 t	45% lifted

District / Division	Official price	Market price	Allocation vs lifted	Status
Mymensingh Division	official MRP	above MRP	9,992 / 31,425 t	32% lifted

Table 1. District distribution snapshot: allocation versus lifting and official versus market price — the clearest map of where reform creates value.

Figure 1. Left: share of allocated stock lifted by dealers to date. Right: farm-gate premium over the official price — the space efficiency gains will recover.

2.2 The Targeting Opportunity

Subsidy spending is not only large, it is a tremendous opportunity for precision. The World Bank's assessment shows that the top quintile of landholders currently receive roughly half of every taka spent, while the bottom 40 percent of farmers receive around one seventh of the benefit. Redirecting even part of this flow toward smallholders will multiply the programme's impact on yield, income and national food supply. This is the heart of the reform: the same budget, with exponentially better outcomes for the families who power Bangladesh's agriculture.

Figure 2. Estimated distribution of fertilizer subsidy benefits by landholding group (World Bank assessment).

2.3 Four Levers of Transformation

Four powerful levers define the transformation. First, fiscal excellence: at Tk 17,001 crore per year, fertilizer subsidies represent about 80 percent of public agricultural spending, and every efficiency gain releases fresh resources for extension, research and rural infrastructure. Second, precision targeting, documented above, which will convert anti-poverty spending into maximum farmer benefit. Third, domestic production opportunity: with over 70 percent of demand met abroad, and domestic production of about 1.06 million tonnes against demand of roughly 6.6 million tonnes, there is a clear pathway to strengthen domestic capacity and national resilience. Fourth, environmental stewardship: guiding the 95 percent of farmers who can benefit from balanced-nutrient practices toward optimal application will enrich soils, protect water quality and reduce greenhouse-gas emissions across the rice-growing deltas.

2.4 Asia's Guiding Lesson: Efficiency Is the New Yield

Asia's experience teaches that fertilizer intensity alone does not secure harvests. China credited nitrogen fertilizers with up to half of its yield gains, and India's nitrogen consumption grew from 0.21 million tonnes in 1960-61 to 17.63 million tonnes in 2018-19. The lesson of that expansion is now clear: nutrient use efficiency moved from 61 percent to 50 percent in China and from 50 percent to 42 percent in India, while India invests more than US\$8 billion a year in the input. Bangladesh has the inspiring opportunity to lead the region by pursuing sustainable intensification — optimizing the whole farming system rather than maximizing a single input — and by holding national nutrient use efficiency above the 50 percent threshold, a distinction no large Asian economy has yet achieved at scale.

Figure 3. Nutrient use efficiency across Asia, with the KrishiChain opportunity to lead the region above 50 percent.

3. The Turning Point: Assets in Hand and Lessons from Asia

Reform succeeds when feasibility is proven, and this part proves it twice over: first by showing that the foundational digital assets already exist inside government systems, and second by distilling what four Asian neighbours have generously learned about subsidy reform at scale. The window for leapfrogging to precise, dignified delivery is wide open, and every prerequisite is now in place.

3.1 Foundational Assets Already in Possession

Asset	Status	Strategic function
Digital land mapping (BDS / EDLMS)	20,000+ mouza maps integrated; 138,000 under digitization; Korea MoU of September 2025 accelerating progress	Geospatial layer: links every entitlement to a verified parcel
Krishak Card	Launched April 2026; 120 data points per farmer; 20,671 farmers already receiving Tk 2,500 per year via mobile financial services; target 22 million IDs by 2028	Identity and payment layer: authenticates farmers and routes benefits
2026 Comprehensive Dealer Policy	One dealer per union; a streamlined, transparent dealer network; digital monitoring and strengthened eligibility carry regulation confidently beyond the 2009 framework	Regulatory layer: streamlines and strengthens the distribution channel

Asset	Status	Strategic function
NID and mobile rails	National ID database plus near-ubiquitous mobile coverage	Authentication layer: real-time verification at point of sale

Table 2. The four digital and institutional assets that make biometric, land-linked distribution feasible today.

3.2 India: The Biometric DBT Revolution

India's Aadhaar-enabled point-of-sale system authenticates farmers at retail shops, releasing subsidy only after a verified sale on a no-denial basis since 2018. The network now spans 287,000 retailers serving 84 crore farmers, and an e-Bill system links payments directly to verified dealer sales records. Enforcement has teeth: 12,814 show-cause notices were issued and more than 5,000 licences cancelled in seven months. India is now piloting land- and crop-based pre-booking limits through its app. The scale of commitment is vast — 1.71 lakh crore rupees budgeted for 2026-27, above US\$8 billion annually — proof that major economies now treat farmer investment as a foundation of growth.

Lesson for Bangladesh. Biometric authentication at the point of sale is the surest foundation for protecting every taka of subsidy value. The shift from blanket subsidies to land-linked quotas is the next frontier, and even a long-established system can be renewed with confidence when the technology infrastructure is robust.

3.3 China: Zero Growth and the Digital Countryside

China removed manufacturing subsidies in 2015 and launched an Action Plan for Zero Growth in Chemical Fertilizer Use, targeting fertilizer utilization above 40 percent and soil-testing coverage above 90 percent through the STFFT and organic replacement programmes. Rural digital infrastructure made the difference: over 99 percent of villages have fibre or 4G, about 80 percent host farmer information societies, and farmers reached by internet information apply fertilizer 3.5 percent more efficiently. Competitive e-commerce markets pushed operators to cut chemical use to protect product reputation.

Lesson for Bangladesh. Subsidy optimization works best when paired with strong investment in physical infrastructure and technical support. Digital infrastructure must precede or accompany subsidy reform, and market incentives can change behaviour even more powerfully than input subsidies alone.

3.4 Vietnam: Precision and Low-Emission Rice

Vietnam's One Must, Five Reductions programme pairs certified seeds with simultaneous cuts in seeding rates, fertilizer, pesticide, water and post-harvest losses. The Mekong Delta's one-million-hectare

high-quality, low-emission rice programme has achieved an average 31.3 percent reduction in fertilizer use and a 20 percent cut in nitrogen and irrigation water, with soil health cards delivering tailored recommendations. The Red River Delta, in turn, shows how steady early correction restores soils and water, proof that prevention through soil health cards is the smartest and most affordable investment a delta nation can make.

Lesson for Bangladesh. Precision agriculture and organic integration improve farmer economics and environmental resilience simultaneously. Reduction is not loss: targeted packages for specific value chains drive meaningful change.

3.5 Philippines: Cooperatives and Climate-Smart Models

The Philippines shows both the promise and the limits of cooperative intermediation. The AFEAC cooperative aggregates demand, delivers extension and improves incomes, while the national programme delivered cash subsidies of 5,000 pesos to 600,000 rice farmers and promotes climate-smart coconut-based farming systems. The opportunity is equally clear: with digital tracking added, cooperative strength combines with precision delivery, and stewardship programmes can extend the same care to watersheds such as Laguna Lake.

Lesson for Bangladesh. Cooperatives plus digital tracking are a winning combination that keeps every taka on target. Where verification is strong, cash transfers through mobile rails deliver outstanding results alongside physical input distribution.

4. The Path Forward: Digital Architecture and Strategy

The reform rests on a four-layer digital architecture, each layer mapping to an asset the government already owns. Together they complete the loop from farmer identity to verified outcome, and they transform the subsidy programme into a fully transparent, trusted and auditable circuit.

4.1 The Four-Layer Architecture

Layer	Components	Function
1. Identity and Land	Krishak Card, NID, BDS/EDLMS	Biometric linkage to verified land parcels and crop declarations
2. Point of Sale	Biometric PoS devices at dealer shops	Aadhaar-style authentication with offline capability and local server sync

Layer	Components	Function
3. Tracking and Transparency	Central Digital Ledger with blockchain verification	Immutable record from import or production through dealer to farmer, with a public dashboard
4. Advisory and Verification	National Digital Agriculture Platform, satellite NDVI	Mobile-first soil-health advice and verification of crop declarations

Table 3. Four-layer digital architecture for transparent fertilizer distribution.

4.2 Proof of Concept: KrishiChain BD

KrishiChain BD is the designed proof of concept: 50 dealer bins across Chattogram and Khulna operating for 12 months under the slogan of transparent inputs and sustainable yields. The pilot requires a total investment of US\$219,450 and projects a 72-to-1 return in its first year, reaching farmers at a cost of US\$8.78 each while targeting a 20 percent recovery of currently diverted subsidy. Funding is blended across sources: 40 percent from the Government of Bangladesh, 40 percent from development partners, 10 percent private and 10 percent in-kind from BADC and BCIC.

\$219,450 TOTAL PILOT INVESTMENT	72 : 1 YEAR-1 ROI, UNDER 1 MONTH PAYBACK	20% SUBSIDY RECOVERY TARGET	\$8.78 COST PER FARMER REACHED
--	--	---------------------------------------	--

Figure 4. KrishiChain BD pilot budget breakdown across five cost centres.

The pilot delivers four connected products. A dealer app provides offline-first stock logging with a Bangla voice interface, e-Bill integration and soil-health advisory at the point of sale. Farmer access runs through USSD and SMS as well as a smartphone app, with digital receipts and Soil Health Card integration, an

inclusive design choice for the 68 percent of farmers without smartphones. An officer dashboard exposes real-time heatmaps, leakage-detection alerts and NUE monitoring for evidence-based policy support. A policy engine handles e-Bill processing, the blockchain ledger, AI demand forecasting and BADC MIS integration.

Scaling proceeds in three funded stages: Phase 1 piloting in months 1 to 3 at US\$219,000 to capture 95 percent of transactions; Phase 2 integration in months 4 to 8 at US\$850,000 to recover a fifth of diverted value; and Phase 3 scaling in months 9 to 12 at US\$1.85 million to reach 5,000 dealers and deliver a 10 percent nationwide gain in nutrient use efficiency. Each stage is gated: continuation funding builds proudly on the previous stage meeting its capture and recovery thresholds.

4.3 The Three-Pillar Strategic Framework

Pillar	Core measures
I. Modernize subsidies	e-Bill system linking payments to verified sales (India model); biometric PoS at every dealer; land-linked quotas from BDS/EDLMS parcels; blockchain verification ledger; shift from subsidizing inputs to subsidizing verified outcomes
II. Build institutions	Nationwide Soil Health Card programme on the China STFFT model; village-level Agro-Service Centres bundling inputs, advice, machinery and credit; professionalization of farmer cooperatives on the AFEAC model; extension reform with trusted site-specific advisors; regulatory enforcement capacity
III. Leverage digital and markets	National digital agriculture platform with mobile-centric advisory; market linkages rewarding sustainably produced goods; inclusive voice-UI and USSD design to close the digital divide; AI and machine-learning demand forecasting and early warning; voluntary land consolidation and leasing for economies of scale

Table 4. Three mutually reinforcing pillars carry the reform from pilot to transformation.

5. The Bloom: Outcomes and Strategic Alignment

Reform is worth every effort when the end-state is this concrete. The bloom is described here first through the farmer's lived experience, then through the system-level reality, and finally through the international frameworks the programme is designed to serve.

A farmer in Bhurungamari walks to the authorized dealer, places her thumb on the biometric scanner, and receives her exact entitlement of urea and DAP, calculated from her soil-test results and crop declaration, at the government-fixed price. The transaction takes under ten minutes. No queue. No black market. No uncertainty.

Behind that transaction, the Ministry tracks every kilogram from import or production to final farmer sale on a national digital ledger. Policy becomes evidence-based and proactive. The subsidy investment declines as efficiency improves, releasing funds for the next generation of farmer prosperity; nitrate runoff falls, soils recover, and the Padma-Meghna basins grow healthier every season. Farmer dignity and fiscal discipline turn out to be the same reform viewed from two directions.

5.1 Alignment with Global Frameworks

Framework	Commitments served
SDG 1 - No Poverty	Targeted entitlements raise the subsidy share reaching the poorest 40 percent from 15 to above 40 percent
SDG 2 - Zero Hunger	Reliable, fairly priced inputs raise yields and stabilize food supply
SDG 12 - Responsible Production	Balanced nutrient application replaces over-use; blockchain traceability documents it
SDG 13 - Climate Action	Reduced nitrous-oxide emissions and climate-finance readiness through satellite verification
SDG 15 - Life on Land	Reversal of soil acidification and recovery of delta water quality
FAO Four Betters	Better Production, Better Nutrition, Better Environment and Better Life map one-to-one onto the three pillars

Table 5. Sustainable Development Goal and FAO alignment of the reform programme.

5.2 Agriculture Diplomacy

The reform also repositions Bangladesh internationally. Deepening DBT-PoS cooperation with India, a precision-rice exchange with Vietnam, digital rural-infrastructure learning with China, and the land-digitization partnership with South Korea together position Bangladesh as a leader in South Asian agricultural governance across SAARC and BIMSTEC forums. Satellite-verified sustainable practice, in turn, strengthens the country's hand in climate-finance negotiations, converting environmental discipline into fiscal opportunity.

6. Implementation Roadmap and MEL Framework

Implementation follows four phases over 60 months, sequenced so that each capability is proven before the next depends on it. Foundation builds the regulatory and technical base; integration scales authentication nationwide; optimization shifts subsidy delivery to farmers and strengthens domestic production; sustainability institutionalizes targeting and oversight.

6.1 Four Phases to Full Transformation

Phase	Window	Key deliverables
I. Foundation	Months 1-12	Implementing rules of the 2026 Dealer Policy with digital compliance mandates; biometric PoS pilots in 2 divisions; Krishak Card integration with NID and initial BDS parcels; Soil Health Card sampling in pilot upazilas; local server nodes in pilot unions; KrishiChain Phase 1 with 50 dealers at US\$219K and 95 percent transaction capture
II. Integration	Months 13-24	Nationwide biometric PoS and e-Bill rollout on the India model; fertilizer quotas linked to verified land area and crop type; mobile crop-declaration and pre-booking app; satellite NDVI verification for the Boro season; public transparency dashboard; KrishiChain Phase 2 at US\$850K targeting recovery of 20 percent of diverted value
III. Optimization	Months 25-36	e-Voucher pilots moving subsidy from companies to farmers over MFS rails; Soil Health Card national coverage beyond one million cards; AI and ML demand forecasting; domestic production strengthened as import share falls from 70 toward 50 percent; KrishiChain Phase 3 with 5,000 dealers at US\$1.85M and a 10 percent nationwide NUE gain; BADC MIS fully integrated
IV. Sustainability	Months 37-60	Full transition to targeted, land-linked entitlements; market-linkage platforms rewarding sustainable practices; independent oversight body established; full alignment with SDG 2.4 and the FAO Better Production agenda; self-sustaining efficiency cycle; South Asian agricultural-governance leadership secured

Table 6. The 60-month implementation roadmap, phase by phase.

Figure 5. Phase timeline across the 60-month transformation window.

6.2 Monitoring, Evaluation and Learning: Results Framework

The results framework below is the success backbone of the programme. Every outcome carries a measurable indicator, a baseline, third-year and fifth-year targets, and a named data source. Quarterly Ministry-led technical reviews with DAE, BADC and IT teams, an annual stakeholder forum with farmers and civil society, and smart support triggers — for example local-server redundancy protocols whenever PoS uptime approaches 90 percent — keep execution excellent.

Outcome	Indicator	Baseline	Target Y3	Target Y5	Data source
Transparent distribution	% of sales via biometric PoS	0%	60%	95%	Central Digital Ledger
Equitable access	% of subsidy reaching bottom 40%	15%	30%	40%+	Krishak Card + MFS data
Dealer accountability	% of allocated stock lifted within 15 days	45%	85%	95%	iFMS-style system
Efficiency	NUE improvement index	TBD	+10%	+20%	Soil test + yield data
Farmer satisfaction	% receiving fertilizer at official price	< 50%	85%	95%	Farmer survey
Fiscal integrity	Subsidy leakage rate	High	< 10%	< 5%	Audit + blockchain trace
Environmental	Reduction in excess nitrogen application	TBD	15%	30%	Soil + water quality tests

Table 7. Monitoring, Evaluation and Learning results framework with baselines and five-year targets.

7. Cost-Benefit Analysis

The economic case for reform is refreshingly simple: the reform pays for itself many times over. Efficiency recovery alone is worth Tk 2,000 to 3,000 crore per year, against a capital requirement limited to biometric PoS devices, local servers and soil-testing expansion — all happily scalable through public-private partnership. The trajectory of the headline indicators from baseline to Year 5 is shown below.

Figure 6. MEL indicator journeys from today's baseline to Year 3 and Year 5 destinations.

Performance dimension	Today	Year-5 destination
Subsidy efficiency recovery	Tk 2,000 - 3,000 Cr opportunity identified	Tk 2,000 - 3,000 Cr secured per year
Subsidy share of bottom 40%	~15%	40%+
Nutrient use efficiency	clear headroom for gains	+15 - 20% improvement
Dealer stock-lifting compliance	45%	95%
Farmer transaction time	a morning at the dealer counter	under 10 minutes
KrishiChain pilot ROI	design validated, ready to launch	72 : 1 in Year 1, payback under one month

Table 8. Six-dimension journey from today to the Year-5 destination.

Net position. Modest capital outlay, scalable via public-private partnership, purchases a self-funding reform: efficiency recovery and precision gains repay the programme within two to three fiscal cycles, after which savings compound every year the system runs — a permanent dividend for the nation.

8. Immediate Ministerial Recommendations

Seven actions require the Minister's signature, none of them require new legislation, and each is sequenced to unlock the next. Together they convert this briefing from analysis into execution within a single budget cycle.

1. Issue the biometric PoS circular

Direct the Secretary of Agriculture to mandate biometric point-of-sale piloting in all divisions within 90 days, using Krishak Card and NID authentication as the identity backbone.

2. Link stock allocation to land data

Instruct BADC and DAE to integrate allocation data with the BDS/EDLMS land-parcel database, so that quotas are land-linked by the upcoming Boro season rather than negotiated through dealers.

3. Champion the 2026 Dealer Policy with confident enforcement

Empower the Agriculture Secretary to recognize and reward compliant dealers swiftly, and to correct unlifted stocks or sales above the maximum retail price with predictable, fair consequences. Even-handed enforcement brings out the best in the dealer network.

4. Approve the e-voucher pilot in two districts

Request the Finance Division to transition subsidy delivery from companies to farmers over mobile financial service rails, testing direct farmer-level transfers ahead of national scale-up.

5. Establish the independent oversight committee

Constitute a committee of farmer leaders, civil society and technical experts publishing quarterly transparency reports, institutionalizing shared stewardship beyond the Ministry itself.

6. Deliver one million Soil Health Cards in 18 months

Task SRDI with delivery, starting in the most fertilizer-intensive rice belts, so that entitlements and advisories rest on soil evidence.

7. Approve the KrishiChain BD pilot at US\$219,450

Commence immediately in Chattogram and Khulna, with Phase-2 funding made contingent on achieving the 95 percent transaction-capture rate that validates the model.

9. Nationalist Legacy and Conclusion

Bir Uttam President Ziaur Rahman, the Father of Bangladeshi Nationalism, sought not merely political sovereignty but economic dignity for the Krishak: a disciplined, self-reliant Bangladesh in which rural prosperity flows naturally from institutional justice. A warehouse full of fertilizer becomes a nation full of nourishment the moment every farmer's hands are filled. This reform honours that legacy through three nationalist imperatives: discipline in governance, keeping officer, dealer and minister proudly accountable to the farmer through biometric PoS, the blockchain ledger and public dashboards; empowerment in place of dependency, treating farmers as the rational stewards they are through land-linked, soil-tested entitlements; and self-reliance, reviving domestic production and building a sovereign, future-proof food system on the country's own digital rails of BDS, Krishak Card and NID.

Bangladesh stands at the threshold of a golden chapter. The path forward, illuminated by Asia's experience and powered by the nation's own digital infrastructure, leads toward transparency, accountability, precision and dignity for every farming family. The technology is ready. The policy framework exists. The regional evidence is clear. The decision awaits, and the time is now.

The ultimate measure of fertilizer security is not how much fertilizer Bangladesh has in its warehouses. It is whether a farmer can obtain the right fertiliser, at the right price, at the right place, at the right time.

Provenance note. This report was synthesized and professionally formatted in September 2026 from a public web-published ministerial briefing of the Ministry of Agriculture (Strategic Planning Unit), itself derived from "Learning from Asia: A Blueprint for Sustainable Fertilizer Management in Bangladesh's Smallholder Farms" (February 2026), the KrishiChain BD Digital Transformation Pilot Proposal, and the Comprehensive Strategic Report on Fertilizer Distribution Reform (September 2026), based on verified government data, World Bank assessments and comparative regional analysis.
